WHY CHOOSE INTEGRATED LIGHTING FROM STELLAR?

Uniquely engineered for Sprung.

Cost less than any other option

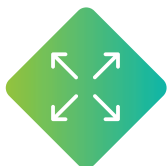

Easier to install

Longest warranty available

Looks better

Greater utility

Stellar
Smart Energy Solutions™

Stellar lights are designed and engineered specifically for Sprung structures to fit snugly on the beams with the wiring hidden inside to allow the ceiling to look clean and uncluttered by wiring. Stellar lights account for the variable height in each Sprung structure and are engineered to uniformly distribute light, maximizing activity and minimizing shadows. Competitor lights all need to be mounted at an equal level above the floor to effectively and uniformly light up a structure, this brings the functional height of the room lower and exposes lights to possible damage. Stellar lights are secured right to Sprung beams with 80% of our hardware hidden from view, allowing users to experience the full height of the structure. Lastly, Stellar lights are made of high-strength aluminum and shatter-proof polycarbonate LED, meaning they can really take a beating.

Installation of a Stellar light package is quick and simple requiring fewer tools, less manpower, and plug-n-play quick connects for efficiency.

Stellar lights cost less than any of our competitors for several reasons. The Stellar light package comes with all of the components necessary for the complete installation of the lights including the electrical mounting box, cover plate, mounting hardware, and plug & play cables for each light. Competitor lights provide you with the price of the lights only requiring these additional items to be included in the electrician's bid. When combined, our prices beat theirs every time. And if that isn't enough, we are committed to match any price if it comes to it. Lastly, installation is significantly less demanding with a Stellar light package allowing you to save on installation costs.

Stellar light installation is as easy as 1, 2, 3. We offer a revolutionary new model of installation that reduces certified electrician involvement 66%. The majority of assembly is plug-n-play requiring no certified electrician once the electrical lines have been run to each location and connected to the electrical mounting box.

Stellar lights have the longest warranty on the market today. We offer a 7 year warranty covering light usage 24 hours per day for a total coverage of 61,000 hours of light usage. A close read of a warranty offered by a major player in this space shows that their 10 year warranty covers average usage of 3 hours per day. This covers only 11,000 hours of light usage or 1 year and 3 months worth of full usage.

Stellar lights look better than anything else available out there! Our tight profile, hidden wiring, and architecturally form-following design can't help but look superior to our competitors in every Sprung structure.

Stellar lights are superior in every feasible way: They are uniquely engineered for a Sprung structure, cost less than any other option, are easier to install, offer the longest warranty available, look better with the innovative Sprung architecture and offer far more utility by allowing users to benefit from the entire height and unique design of their Sprung structure.
